(1) Reported intervals are not true width. At this time, there is insufficient data with respect to the shape of the mineralized system to calculate true orientations in space. They represent drill intersection widths from holes drilled at a dip of -45 to vertical, and oriented (when angled) to the north-northeast. The Bayan Khundii mineralization is interpreted to be moderately dipping (approximately 40 to 50 degrees to the southwest).

(2) End of hole

(3) BKD-73 includes a continuous 8 m interval, representing greater than 10% of the reported interval, that returned less than 0.10 g/t gold

(4) BKD-92 includes two post-mineral dykes, from 128 m to 135.7 m depth and 144.15 m to 155.45 m depth. These dykes have been incorporated into the drill results for hole BKD-92 as 0.00 g/t gold over the combined 19 metres.

(5) BKD-154 contains 9 contiguous meters of less than 100 ppb gold
